Rebar Set in Foundation

Dan and Dave of Blue Water Pools work on installation of rebar to strengthen the lighthouse foundation.

A complex web of iron rebar was set over the pilings as construction of the lighthouse foundation continues. The rebar was installed according to engineering specifications within the wooden forms that will hold the concrete base.

Once the project engineer approves the rebar installation, concrete can be poured. Work on the foundation is being performed by Blue Water Pools of St. George Island.

Today the area underneath the foundation will be treated for termites to prevent future investation of the massive wooden pole that will be installed to support the spiral staircase.
